This invention relates to novel peptides useful for detecting and targeting primary receptors on endothelial cells that bind vacular endothelial growth factor (VEGF). Specifically, it refers to detecting the receptor tyrosine kinase identified as VEGF-2, which is also kown as kinase domain region (KDR) and foetal liver kinase-1 (flk-1). The present invention describes the involvement of the VEGF/KDR complex as important in angiogenesis, and that VEGF/KDR complex binding polypeptides can be used for imaging neoplastic tumours. Purthermore, these compositions are useful for targeting radiotherapeutics to specific sites for treating diseases associated with KDR activation, which include malaria, HIV, SIV infection, simian haemorrhagic fever virus and enterohaemorragic Escherichia activities including protozzacidal, anti-
                                                                                                                                                                                                                                                                                                                                                                                            New polypeptide that binds to vascular endothelial growth factor receptor -2, useful for diagnosis and treatment of e.g. tumors, and its conjugates with therapeutic or imaging agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cyclic KDR/ VEGF binding peptide of the secondary MTN13 library Seq 241.

Kinase domain region (KDR) to vascular endothelial growth factor
(VEGF)/KDR complex. Specifically, it refers to polypeptides, peptide
climers and multimeric complexee that bind with high affinity to KDR (also
known as the VEGF receptor 2 (VEGFR2) and detail liver kinase 1 (flk.1))
or the VEGF/KDR complex, and as such due to the involvement of VEGF and
CC KDR in angiogenesis these binding peptides can be used for imaging
important sites of angiogenesis, as well as in targeting therapeutics to
such sites. The present invention describes these peptides as useful for
promoting or inhibiting angiogenesis and pathogenic conditions associated
thereof such as neoplastic tunours. Furthermore, these binding peptides
are useful for treating malaria, HIV infection, SIV infection, simian
hadmorrhagic fever virus infection and enterohaemorrhagic Escherichia
coli infection. Accordingly, they exhibit cytostatic, antiangiogenic,
antimalarial, anti-HIV, virucidal and antibacterial activities. In
particular, they inhibit VEGF activation of its receptor (i.e. KDR), and
enable efficient detection, imaging and localisation of activated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel isolated polypeptide having ability to bind to kinase domain region or vascular endothelial growth factor/kinase domain region complex, useful in inhibiting vascular endothelial growth factor activation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Immunogenic peptide having a human leukocyte antigen binding motif #2136.
                                                                                                                                                                                                                                                                                                                                                      Sato AK, Sexton DJ, Dransfield DT, Ladner RC, Arbogast C;

having a human major histocompatibility complex (MHC) Class I (also known as human newlocyte antigen (HLA)) binding motif. The immunogenic peptides as human leukocyte antigen (HLA)) binding motif. The immunogenic peptides can bind to a specific HLA allale (i.e. HLA-A subtypes HLA-A-I, Al, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T ceal response against the antigen from which the peptide is derived. Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and are particularly important in therefore useful therapoutically to treat or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to licit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytocoxic T cell with the peptide e.g. to produce CTLS ex vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful therapeutically and for immunisation as above
                                                                                                                                                                                                                                                                                                                                                                                                                                               New immunogenic peptides with HLA binding motif, useful in treatment and diagnosis of cancers and viral diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           to AAY48214 represent specifically claimed immunogenic peptides

The present invention relates to self-assembling dipolar oligopeptides and di-and tri-block peptide copolymers. The dipolar oligopeptides have and di-and tri-block peptide copolymers. The dipolar oligopeptides have ability to self assemble to form stabble ananotubes. The self-assembled nanostructure have the ability to entrap and deliver molecular systematic design, modification and synthesis, can be subjected to extensive molecular modelling and simulations before synthesis; can be highly purified to be mono-dispersed macreials; combinatorial approach can be employed to systematically characterize these co-polymers at various ratio, and can be synthesized in vitro or in vivo. The nanotubes fuse with the lipid bilayers and do not deform the cells as liposomes do. The oligopeptides can be used in a self-assembled nanostructue (e.g. nanotube) for delivering drug into a cell and as a carrier for biologically active materials. The present sequence is one such di-block oligopeptide
                                                                                                                                                                                                                                                                  New dipolar oligopeptides in a self-assembled nanostructure useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The invention relates to a chimeric folded protein domain derived from a repertoire of chimeric proteins. The chimeric protein comprises two or more sequence segments derived from parent amino acid sequence that are non-homologous. The chimeric protein is useful in vaccination against one or more of the amino acid sequences from which the chimera is derived, for administration to a human for therapeutic purposes, and for use in a commercial product to which humans are exposed. The chimeric protein is useful as improved enzyme inhibitors, and to avoid sensitisation in thumans (for e.g. enzymes and washing powders). The present sequence is N-terminal His-tag peptide sequence of Escherichia coli cold shock protein (CspA) used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel chimeric folded protein domain, useful in vaccination, is derived from a repertoire of chimeric proteins and comprises two or more sequence segments derived from parent non-homologous sequences.
                                                                                                  Chimeric folded protein domain derived from repertoire of chimeric proteins useful therapeutically, comprises two or more sequence segments derived from parent amino acid sequence that are non-homologous.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a chimaeric folded protein domain, when derived
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          from a repertoire of chimaeric proteins comprises two or more sequence segments derived from parent amino acid sequences that are non-homologous. Also included are nucleic acids encoding the chimaeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CspA; chimaeric folded protein domain; His tag; cold shock protein; vaccine; asthma; proteolysis resistance.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               셤
                                                                                                                                                                                                                                                                                                         activity, comprising a fluorescent protein moiety and at least one exogenous substrate recognition motif for an activity, where the exogenous substrate recognition motif for an activity, where the fluorescent protein moiety and where the fluorescent protein moiety and where the fluorescent compound state in response to the activity, and where the fluorescent compound exhibits a different fluorescent property in the two states under comparing conditions. The activity is an enzymatic activity, preferably a kinase, phosphatase, proteins, glycosplation or farmaser transferase activity. The fluorescent protein moiety comprises an Aequorea-related fluorescent protein preferably comprising the mutations in GFP mutant K8, where at least one substrate recognition motif for an activity is within the first 20, more preferably the first 10 amino acids of the amino the first 20, more preferably the first 10 amino acids of the amino condition is acid quenching. The moiety preferably comprises a poly-lys region and a protein-protein interaction domain and is membrane bound. The quenching condition accomplision motif for a serine/threomine specific protein kinase, protein kinase A, protein kinase I or II or MAP kinase activated protein kinase. The protein kinase activated protein kinase. The protein kinase activated protein kinase. The present sequence represents a phosphorylation compound is used to detect enzymatic activities in biological samples. The present sequence represents a phosphorylation compound of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                               A fluorescent compound comprising a fluorescent protein moiety and a ubstrate recognition motif for an activity, which exhibits a change in fluorescence in response to the activity, used to detect enzyme activity in biological samples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Escherichia coli cold shock protein (CspA) N-terminal His-tag peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

proteins encoded by the nucleic acid sequences. The encoded proteins comprise an immunogenic portion of a Chlamydia antigen. The encoded proteins are useful for the serodiagnosis and treatment of Chlamydia infection. Chlamdiae are intracellular bacterial pathogens that are responsible for a wide variety of human infections. C. trachomatis infection is one of the most common sexually transmitted diseases and can infection is one of the most common sexually transmitted diseases.

lead to pelvic inflammatory disease (PID), resulting in tubal obstruction and infertility. Trachoma due to ocular infection with C. trachomatis is the leading cause of preventable blindness worldwide. C. pneumonia is a major cause of acute respiratory tract infections in humans and is a laso thought to play a role in the pathogenesis of atherosclerosis and coronary heart disease. The present sequence is a protein isolated in the present invention

```
proteins His-2f3 and His-1c2 were used for immunisation of a rabbit to analyse, if resulting antisera from the immunisation of a rabbit to crossreactive with CspA. The animals were then challenged with an injection of folded cold shock protein (CspA) to see if a specific anticaph incommunisation of a manalyses of the rabbit immune response involving T cell mediated help was established during immunisation. The analyses of the rabbit immune response showed, that immunisation with both 2f3 and 1c2 raised antisera highly reactive with their respective antigen as they bound phage displaying the chimaeric proteins strongly after the second, third and fourth vaccination. Crossreactivity with CspA was observed. The protein domain is useful in vaccination against parent proteins from which the chimaera is derived, for administration to a human for therapeutic purposes and for use in commercial product to which humans are exposed. The protein domains are useful for treating asthma and in immunisation. The chimaeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     protease enzymes and is not immunogenic or weakly immunogenic, and hence suitable for therapeutic purposes and to avoid sensitisation in humans. The present sequence is a His tag which is added to chimaeric proteins of the invention to aid protein purifaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     folded protein domain is resistant to in vivo or in vitro proteolysis by
   protein domains and a method of producing the protein domains. Chimaeric

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 56, Application US/09711485

| Sequence 56, Application US/09711485
| Patent No. 6649742
| GENERAL INFORMATION:
| APPLICANT: Better, Marc D.
| APPLICANT: Studnika, Garroll, Stephen F.
| TILLE OF INVENTION: Immunotoxins Comprising Ribosome-Inactivating
| TITLE OF INVENTION: Droteins
| TITLE OF INVENTION: Proteins
| NUMBER OF SEQUENCES: 169
| CORRESPONDENCE ADDRESS:
| ADDRESSEE: McAndrews, Held & Malloy, Ltd.
| STREET: 500 West Madison Street, 34th floor
| CITY: Chicago |
| STATE: Illinois
| CONNTRY: USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Length 20;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           COMPUTE: TOTO!

COMPUTE: TOTO!

OPERATIONS SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PATENTIN Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/816,977
FILING DATE: 13-MAR-1997
CLASSIFICATION: 424
ATTORNEY/AGENT INPORMATION:
NAME: MACKLight, Kamrin T.
REFERENCE/DOCKET NUMBER: 38,230
REFERENCE/DOCKET NUMBER: 38,230
TELEPHONE: (415) 705-8410
Sequence 33, Application US/08816977

Patent No. 6080400
GENERAL INFORMATION:
APPLICANT: Williams, James A.
APPLICANT: Byrne, Lisa M.
TITLE OF INVENTION: Prevention And Treatment Of TITLE OF INVENTION: Prevention And Treatment Of CONTRESPONDENCES: 49
CORRESPONDENCE ADDRESS:
ADDRESSEE: Medlen & Carroll, LLP
STREET: 220 Montgomery Street, Suite 2200

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Description

-!- SUBUNIT: The Shiga-like toxins contain a single A subunit and
multiple copies of B subunit.
-!- SIMILARITY: Belongs to the ribosome-inactivating protein family.
                                                                                                                                                                                                                                                                            MEDLINE=88190113; PubMed=3357883;
